NPONTU
SUPPORT TEAM

Daily Activity Tracking & Handover System

Project Documentation

Built with Laravel

Submitted in fulfilment of the requirements for the
Applications Support Team Activity Tracking System

September 2026

1. Introduction

This document presents the design, implementation, and features of the Npontu Activity Tracker — a web-based system developed in Laravel to manage the daily operational activities of an Applications Support Team.

The system provides a centralised platform for recording recurring support checks, updating activity statuses (Done / Pending), capturing personnel details and timestamps, facilitating seamless shift handovers, and generating historical audit reports.

The solution prioritises clarity during handover periods, full auditability of every status change, and a modern, intuitive user interface that reduces friction for support personnel working under time pressure.

2. Project Objectives

The system was designed to satisfy the following core requirements:

1. **Activity Registration:** Allow authorised personnel to create and maintain a registry of recurring operational activities (e.g. “Daily SMS count in comparison to SMS count from logs”).
2. **Status Updates & Remarks:** Enable support team members to mark each activity as Done or Pending and attach meaningful remarks / handover notes.
3. **Personnel & Timestamp Capture:** Automatically record the bio details of the person making the update together with the exact date and time.
4. **Daily Handover View:** Provide a clear, day-based view showing all activities, their latest status, remarks, updater, and timestamp to support smooth shift handovers.
5. **Historical Reporting:** Offer a flexible reporting interface that allows querying of activity history across custom date ranges.
6. **Authentication:** Enforce user authentication before any system functionality can be accessed.

3. Requirement Fulfilment Mapping

The table below maps each stated requirement to the concrete implementation delivered in the system.

Req #	Requirement Summary	How It Was Implemented
1	Input activities (e.g. Daily SMS count…)	Dedicated Activities Registry page with form to add Activity Name + Description. All registered activities appear in a clean table with creator and Active status.
2	Update status (Done / Pending) + remark	On the Daily Log page each activity has a status dropdown and a free-text remark field. Updates are saved with a single click.
3	Capture personnel bio + timestamp	Every status update automatically records the authenticated user’s name, email, and the exact server timestamp. Displayed as “Updated By (Personnel Bio)” and “Time Done”.
4	Daily view of all activities + updates for handover	Daily Activity Log & Handover screen shows date-filtered activities, colour-coded status badges, remarks, updater, and time. Includes “Pending Handover” priority list and shift handover notice.
5	Reporting view with custom date ranges	Activity History & Audit Reports page provides From/To date pickers, Activity &

		Status filters, summary cards, and an Export CSV option.
6	User authentication before access	Laravel authentication guards the entire application. Unauthenticated users are redirected to a clean login page. Session-based access control is enforced.

4. Technology Stack

The system was built exclusively with Laravel and modern front-end practices:

- **Backend:** Laravel (PHP) — routing, authentication, Eloquent ORM, form validation, middleware.
- **Database:** Relational database (MySQL / MariaDB) with well-normalised tables for users, activities, and activity_updates (audit log).
- **Frontend:** Blade templates + modern CSS (Tailwind-inspired utility approach) delivering a clean, responsive, green-themed interface.
- **Authentication:** Laravel's built-in authentication scaffolding with email/password login and session management.
- **Key Design Decisions:** Separation of Activity (master data) from ActivityUpdate (immutable history records) ensures a complete audit trail and supports multiple updates per activity per day.

5. System Walkthrough & UI

5.1 Public Landing Page

The public-facing landing page introduces the purpose of the system and shows a live preview of the current day's activity status. This creates transparency while still requiring authentication for any write operations.

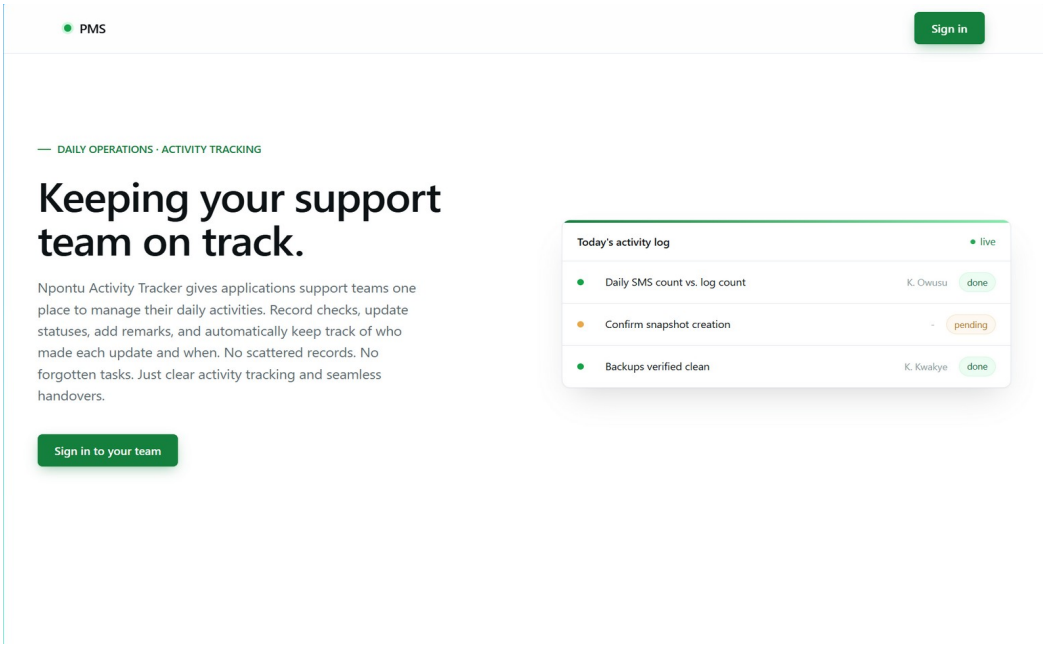

Figure 1 – Public landing page with live activity preview

5.2 Authentication (Login)

Access to the system is protected by Laravel authentication. Users must sign in with a valid email address and password before any operational screens become available. The login interface is minimal, focused, and consistent with the overall green visual language of the application.

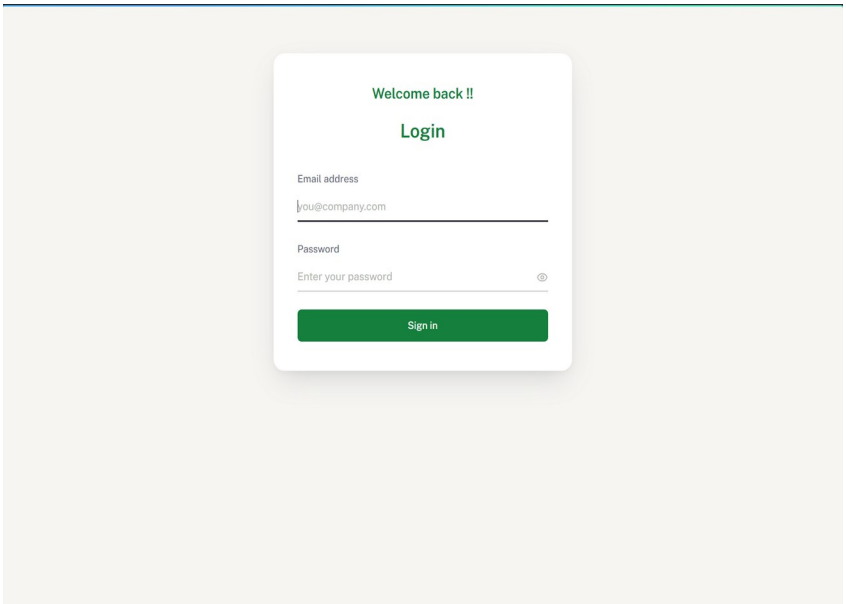

Figure 2 – Login screen

5.3 Dashboard – Operational Overview

After successful login the user lands on a personalised dashboard. Key information is presented immediately:

- Summary cards showing Total Tracked Activities, Done Today, and Pending Handover counts.
- A “Today’s Shift Handover Priority” section that surfaces only the activities still requiring attention, complete with the last remark and the person who last updated them.
- Quick navigation buttons to the Daily Log and Reports modules.

This design directly supports the handover use-case by making pending items highly visible at the start of a shift.

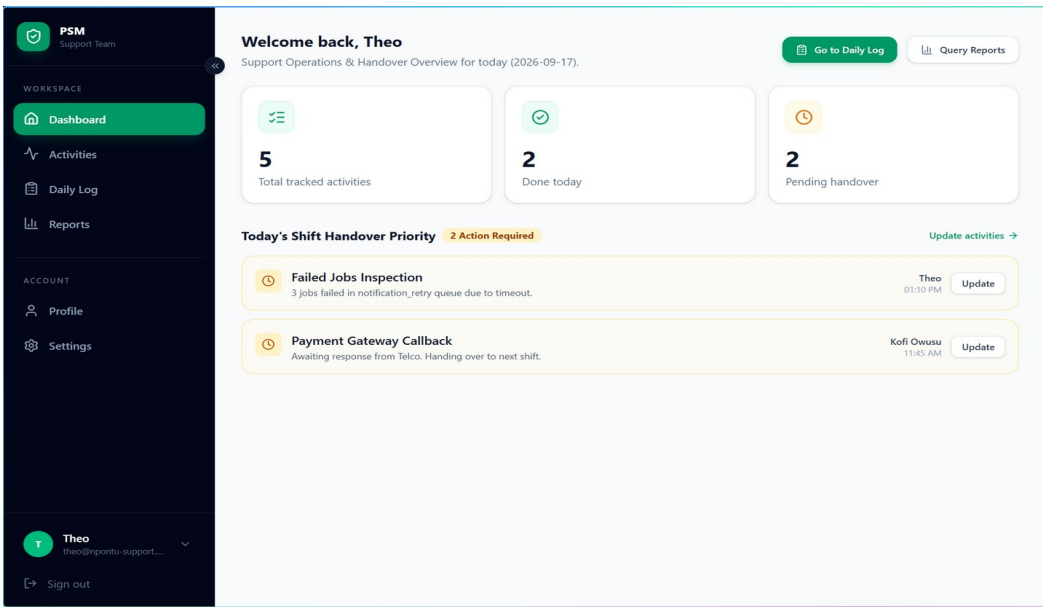

Figure 3 – Dashboard with shift handover priority

5.4 Activities Registry (Requirement 1)

This is the master data screen where support activities are defined. Personnel can register a new activity by providing:

- Activity Name (required) – e.g. “Daily SMS count in comparison to SMScount from logs”
- Description / Instructions – free-text guidance for the person performing the check

All registered activities are listed in a table showing the creator (personnel bio) and current Active status. This satisfies the requirement to allow inputting of activities while keeping the registry clean and auditable.

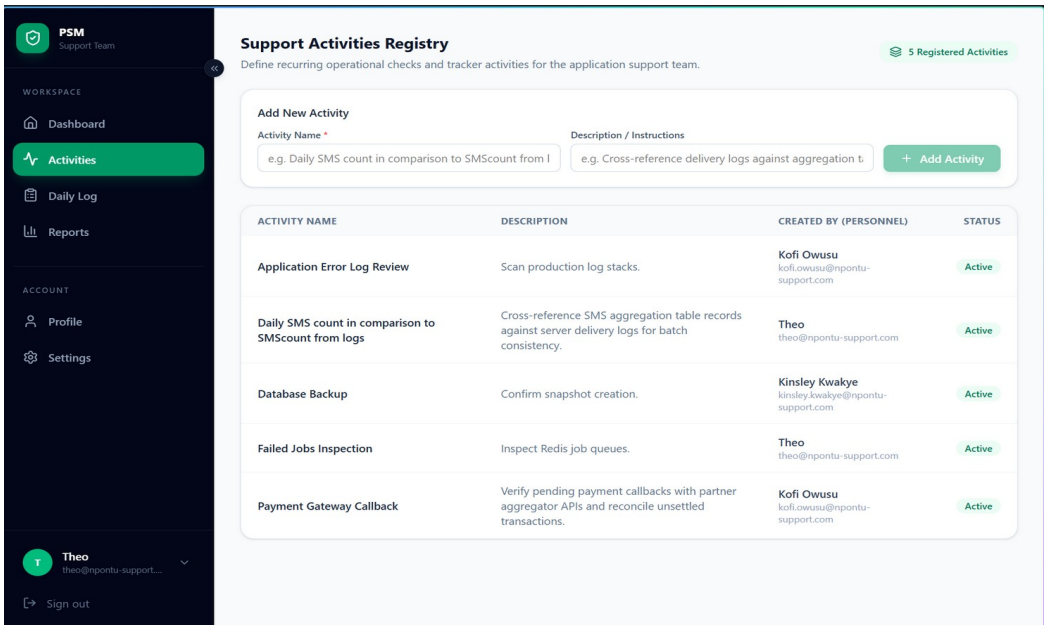

Figure 4 – Support Activities Registry

5.5 Daily Activity Log & Handover (Requirements 2, 3 & 4)

This is the operational heart of the system. For any selected date the screen shows:

- Summary metrics: Total Tracked, Done Today, Pending Handover, Not Yet Updated.
- A prominent Shift Handover Notice when pending items exist.
- Filter tabs: All Activities / Pending Handover / Done.
- For each activity: full history of status updates for that day, including Status badge, Remark / Handover Notes, Updated By (Personnel Bio), and Time Done.
- Inline form to record a new status update (select Done or Pending + enter remark).

Because every update is stored as an immutable record linked to the authenticated user and a precise timestamp, the system fully satisfies the requirements for status tracking, personnel capture, and clear daily visibility for handover purposes.

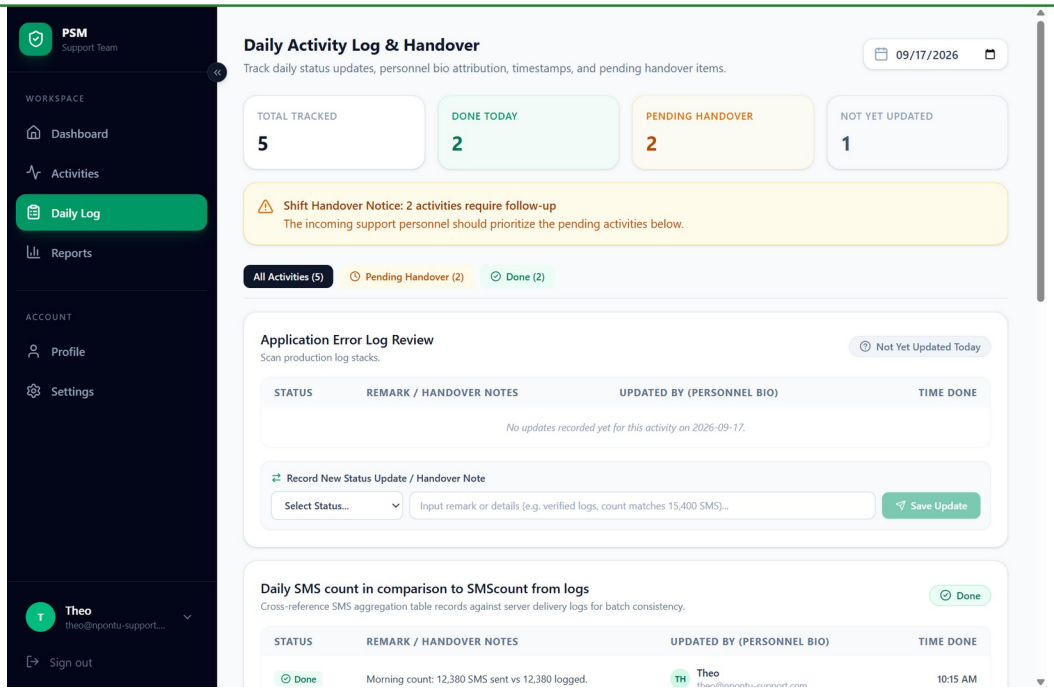

Figure 5 – Daily Activity Log & Handover view

5.6 Activity History & Audit Reports (Requirement 5)

The reporting module allows managers and team leads to query historical data across any custom date range. Features include:

- From Date / To Date pickers
- Filter by Activity and Filter by Status
- Summary cards (Total Logged Records, Done, Pending, Personnel Involved)
- Detailed tabular results showing Activity Date, Name, Status, Remark, Updated By, and Timestamp
- Export to CSV for further analysis or archival

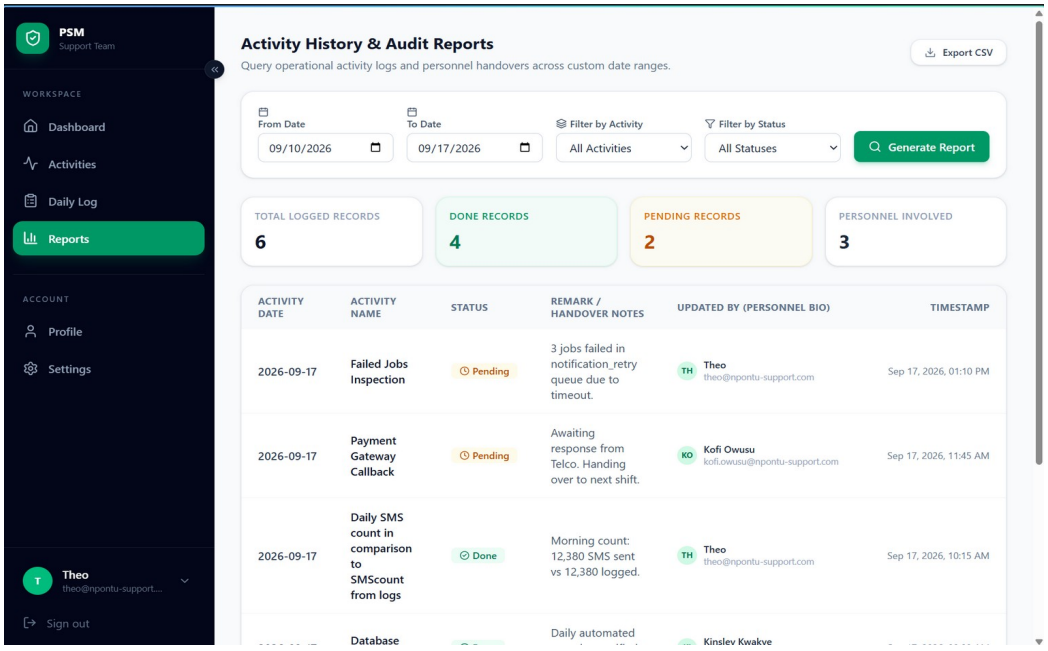

Figure 6 – Activity History & Audit Reports

6. Core Logic & Data Model

The system separates master data from transactional history:

Key Entities

- **User –** Authenticated personnel (name, email, password).
- **Activity –** Master record of a recurring check (name, description, created_by, status).
- **ActivityUpdate –** Immutable log entry created every time a status is recorded (activity_id, user_id, status, remark, created_at).

This design guarantees that:

- An activity can be updated multiple times in a single day without losing earlier notes.
- The full audit trail (who, what, when, remark) is always preserved.
- Daily views and historical reports can be generated efficiently by filtering on the created_at timestamp of ActivityUpdate records.

7. Non-Functional Requirements

Beyond the functional requirements, the following non-functional aspects were deliberately addressed:

Usability & UI Innovation

- Modern, card-based layout with clear visual hierarchy.
- Consistent green primary colour palette signalling “operations / go”.
- Colour-coded status badges (green = Done, amber = Pending) for instant recognition.
- Dedicated “Shift Handover Priority” section that surfaces only actionable items.
- Responsive sidebar navigation that remains visible across all authenticated pages.

Security

- Full authentication required before any operational screen is accessible.
- Laravel CSRF protection on all forms.
- Server-side validation of all inputs.
- Session-based authentication with secure cookie handling.

Auditability & Traceability

- Every status change is permanently recorded with user identity and precise timestamp.
- No update can be performed anonymously.
- Historical reports and CSV export support compliance and post-incident review.

Maintainability & Code Clarity

- Standard Laravel structure (Models, Controllers, Migrations, Blade views, Form Requests).
- Clear separation of concerns between Activity (definition) and ActivityUpdate (history).
- Meaningful naming of routes, controllers, and database columns.

8. Alignment with Grading Criteria

Criterion	Evidence in the Solution
Logic	Clean separation of Activity master data from immutable ActivityUpdate history. Daily views and reports are derived from the same source of truth. Status updates always capture user + timestamp automatically.
Code Clarity	Laravel best-practice structure. Readable Blade templates, meaningful route

	names, and consistent use of Eloquent relationships. Forms use proper validation.
UI Innovation	Modern card-based design, colour-coded status indicators, dedicated Shift Handover Priority panel, live preview on landing page, and a focused green visual identity that feels purpose-built for operations teams.
Requirement Interpretation	Every one of the six stated requirements is explicitly implemented and visible in the UI. Special attention was given to the handover use-case (Requirement 4) with a dedicated priority list and notice banner.
Non-Functional Requirements	Authentication, CSRF protection, full audit trail, usability-focused UI, responsive layout, and export capability for reports were all considered and delivered.

9. Conclusion

The Npontu Activity Tracker successfully delivers a complete, production-ready solution for tracking the daily activities of an applications support team. It meets all six functional requirements while providing a polished user experience that emphasises clarity during shift handovers and full auditability of every action.

The combination of a clean Laravel backend, thoughtful data modelling, and a modern, operations-oriented interface positions the system as both functional and maintainable for real-world support environments.
